

THE TURBO-BEAVER'S MAIDEN FLIGHT

Canadian designed and built, the new De Havilland Turbo-Beaver recently took the air on flight test. All program phases, from systems' mock-ups, static engine runs to in-flight behaviour, successfully met performance goals and rigid time schedules.

Substantial improvements are brought by the Beaver's turbine engine configuration. Notably, ease of cold starts under extreme temperatures and whisper-quiet cabin conditions; with increased speed, improved STOL performance and payloads. The Turbo-Beaver also gains in operating economies and line maintenance.

Sturdy construction combined with outstanding versatility, fit the Turbo-Beaver for utility roles in both commercial and military applications.

The new De Havilland Turbo-Beaver takes off on maiden flight.
